CMYK COLOR SEPARATIONS IN PHOTOSHOP FOR SCREEN-PRINTING

PROFESSOR: JAMES BAILEY

- 1. Launch Photoshop.
- Open your image. (Make modifications if needed and then SAVE IT AS A NEW FILE BEFORE PROCEEDING). I recommend lightening the image a bit (use Levels) as CMYK tends to make the image a bit darker. (IMPORTANT!!!! Size it to the final size you want your print to be <u>BEFORE</u> you do the next steps)
- 3. MB>IMAGE>MODE>CMYK Color

You will then see our image has been broken down into five channels of color. Each channel contains a certain percentage of color to create the colors in the final work.

4. MB>Window>Channels

5. Save your file.

6.

Open the flyout menu> Split Channels

You will now see the four individual plates. Each file open is named after the original file and has the color name appended to the filename. (These Might appear at the top of your screen above the ruler guide & below the menu bar, and may look like Title_Cyan@100% Gray; Title_Magenta@ 100% Gray and so on.

🔂 bird.jpg.Cyan @ 100% (Gray/8#)
¹
🗟 bird.jpg.Magenta @ 100% (Gray/8#)
¹
🗟 bird.jpg.Yellow @ 100% (Gray/8#)
🔚 bird.jpg.Black @ 100% (Gray/8#)

- 7. Now we will convert each of these files to a black and white halftone.
- 8. Click on the first Channel and go to:. For example Yellow. (You should see just a yellow and white image).
- You will have to select all > COPY > Paste info a new file.
 I highly recommend you name it using the channel & mesh count you plan to use. For example: Yellow_230 mesh (this way you remember the halftone size your using)
- 10. MB>Image>Mode>Bitmap

Bitmap	
Resolution Input: 600 pixels/inch Output: 600 pixels/inch	OK Cancel
Method Use: Halftone Screen	
Custom Pattern:	

Type in 600 pixels/inch in the output box. Method is Halftone Screen. And click OK.

Next we are presented with our halftone settings.

11. For the Frequency box it's (Mesh count divided by 4)

I.e. A screen with a mesh count of 200 would use a 50 LPI. So 50 would be the frequency. You can always use a rougher (larger dot) on a finer mesh, you CANNOT use a fine dot on a rougher mesh. For example: you can print a 30 frequency on a 230 mesh, you can't print a 50 frequency on a 100 mesh.

Halftone Screen				
Halftone Screen		ОК		
Frequency: 50	lines/inch 🛟	Cancel		
Angle: 45	degrees	Load		
Shape: Ellipse 🛟		Load		

12. Next type in the Angle:. (In this case for Black the angle will be 45 degrees).

- 14. Then save file as Black. (TIFF File is fine).
- 14a. Then click on the next channel and repeat for all remaining channels.

You are now ready to print.

- 15. Go to MB>File>Print with Preview (or Apple P key)
- 16. Click on "Color Management" at top: Click on Registration Marks and then click print.

	Print	
	Printer: HP LaserJet 1022 Copies: 1 Page Setup Position Center Image Top: 2.965 Left: 2.083 Unit: inches Scale to Fit Media Scale: 100% Height: 4.261 Width: 3.828 Unit: inches Content of the set of th	Output Printing Marks Calibration Bars ✓ Registration Marks Corner Crop Marks Center Crop Marks Description Labels Emulsion Down Negative Functions Background Breed Screen Transfer Interpolation Include Vector Data Encoding: Binary
<u></u>	Print Resolution: 600 PPI Match Print Colors Show Bounding Box Print Selected Area	Done Print

The registration marks you've set up will print, so use 1 or 2 sheets of paper to proof on, to line up your image with your pin registration. Then put a piece of scotch tape over each registration mark on the underside of the screen to prevent the registration marks from printing on the rest of your edition.

IMPORTANT NOTE WHEN PRINTING:

Typically, the order of printing is: start 1- Yellow, 2-Magenta, 3-Cyan, and finally 4-Black. (YMCK) but also note that starting with Magenta can work well too. (MYCK).

The process colors are semi-transparent, which allows them to intermix to create the other various colors. Therefore, when printing, it is important to print each color using a **SINGLE PRINT STROKE**, <u>do not double pull the print</u> <u>stroke</u> or this will alter the result, by essentially putting down two layers of the same color and making that color more opaque.
